

# SIX REASONS

## GRID-GUARD PIPELINE PROTECTION IS SUPERIOR TO THE COMPETITION

1

**EASY TO INSTALL**

The installation of rock shield is a tedious and repetitive job, which can be quite strenuous on the install crew. Grid-Guard is half the weight of the competition making it much less taxing to handle and apply.

2

**ECONOMICAL FREIGHT**

Since Grid-Guard is much lighter than the competition, freight providers can fit more square footage per load, thus lowering freight costs.

3

**COLD RESISTANT**

Some of the common rock shield competitor products are constructed from PVC, which is a plastic that can become brittle at below-freezing temperatures. Grid-Guard, however, is constructed from polyethylene, which remains impact resistant and durable at extreme cold temperatures.

4

**WON'T BUNCH UP**

The three-dimensional mesh pattern of Grid-Guard creates a consistent and uniform structure that is dimensionally stable. This ensures that the Grid-Guard won't be caught on un-even areas and bunch up in cradles during installation. This also allows for much wider spacing between tape wrap, up to 18".

5

**LARGER ROLLS**

Grid-Guard HD-Plus comes in longer rolls than the competition (up to 50'), whilst remaining at the industry standard of 3/8" thick. Less overlap equals less labour and creates cost savings at every mile.

6

**EXTRA PROTECTION**

Grid-Guard HD-Plus is constructed with a geotextile backing. This extra layer of defense adds 30% more impact protection and it is completely permeable, allowing water to flow through easily.
